

Make the screen easier to see.

Most residents never change a setting. Two toggles — **bold and bigger** — transform the whole phone. Set it with them, and stop at comfortable.

The two big wins

Bold Text — instant clarity.

Accessibility → Display & Text Size → Bold Text.

Larger Text, dragged up.

Same menu; slide well past the normal range.

Unlock the biggest sizes.

Turn on ‘Larger Accessibility Sizes’ for more room.

Set it with them, not for them

Let them feel the difference.

Toggle Bold on and off so they see it change.

Stop at comfortable, not maximum.

Too big breaks layouts and hides buttons.

Show them it’s reversible.

Fear fades once they know they can slide it back.

Bigger than just text

Display Zoom enlarges everything.

Display & Brightness → Display Zoom → Larger Text.

It grows the Home icons too.

Often the change they notice most.

Add the Text Size button.

Control Center — lets them resize per app.

Sharper, not just bigger

Increase Contrast.

Darkens text edges against the background.

Reduce Transparency.

Makes menus solid so text stands out.

Brightness up.

The simplest fix people forget.

Mind the trade-offs.

Huge type plus zoom can crowd the screen.

Keep them independent

Leave them the large-print card.

The settings, in their hands.

Everything here is reversible.

Say it out loud; it lowers the stakes.

Pair it with the Magnifier card.

Screen for the phone; Magnifier for paper.

If it goes wrong

Buttons vanished off-screen?

Text too large — nudge the slider back.

An app looks broken.

Some apps ignore big text — normal, not damage.

Helping elders keep their independence — and giving their helpers the tools to do it well.
