

A magnifying glass on your screen.

This puts a small lens on the screen that magnifies whatever it sits over — text, photos, buttons — in any app. Apple calls it Window Zoom.

SET UP • ONE TIME **Switch on the lens**

Best set up **with a helper** the first time — it uses three-finger taps you'll want to practice.

1

Open **Settings**, then **Accessibility**

Two taps to get started.

2

Tap **Zoom**, then turn it on

The big switch at the top turns green.

3

Tap **Zoom Region**, choose **Window Zoom**

This is the floating-lens version.

4

Turn on the **Zoom Controller**

A little button to tap instead of three-finger taps.
Optional, but handy.

Nothing here is permanent. A **three-finger double-tap** turns the lens off any time.

Move the lens, **read anything.**

EVERY DAY Using the lens

The lens magnifies whatever sits under it. Here's how to move and size it.

Turn it on with three fingers.

Double-tap the screen with three fingers. Do it again to turn it off.

Slide the lens by its handle.

Drag the little bar at the bottom of the lens to wherever you want to read.

Make it bigger or smaller.

Triple-tap with three fingers, then drag the Zoom Level slider.

Resize the lens itself.

In that menu, tap “Resize Lens,” then drag the round handles.

Prefer a button? Use the Controller.

Tap the floating button for the same menu — no three-finger taps needed.

If the three-finger taps feel tricky, the **Controller button** does it all. Practice a few times — it gets easy.
